

## Product Overview

The NIRSP31 series devices are triple-channel digital isolators with integrated isolated DC-DC converter. The isolated DC-DC converter provides stable output voltage and up to 400mW output power by closed-loop control and transformer on chip. The feedback PWM signal is sent to primary side by a digital isolator based on Novosense capacity isolation technology. The high integrated solution can help simplify system design, save PCB area and improve reliability. The NIRSP31 series devices support 3kVrms insulation 1min withstand voltage. The data rate of the NIRSP31 series devices are up to 20Mbps, and the common-mode transient immunity (CMTI) is up to  $\pm 50\text{kV}/\mu\text{s}$ .

The NIRSP31 series devices provide 5V to 5V, 5V to 3.3V, 3.3V to 3.3V conversion mode. The output voltage can be set by SEL pin.

## Key Features

- Power supply voltage:  
 VDD: 3V to 3.6V, 4.5V to 5.5V for NIRSP31V  
 4.5V to 5.5V for NIRSP31  
 VDDL: 1.8V to 3.6V, 4.5V to 5.5V
- Output Support Current:  
 80mA for 5V to 5V/3.3V  
 45mA for 3.3V to 3.3V
- Over current and over temperature protection
- Date rate: DC to 20Mbps
- High CMTI:  $\pm 50\text{kV}/\mu\text{s}$
- Propagation delay: <75ns
- Operation temperature: -40°C~125°C
- RoHS-compliant packages: LGA-18

## Applications

- Industrial Battery Management System
- Industrial automation system
- Isolated RS232, RS485, CAN
- General-purpose multichannel isolation

Table 1.1 Pin Functions

PIN NO.	SYMBOL	FUNCTION
1	EN	Power enable, When tied to VDDP or floating, the VISO output voltage is active. When a logic low voltage is applied, the VISO output voltage is shut down.
2	R	Logic Output of R2
3	DE	Logic Input of DE2
4	D	Logic Input of D2
5	GND <sub>1</sub>	Isolator Side 1 Ground, The ground reference for VDDP and VDDA.
6	VDDP	Power Supply for Isolator Side 1
7	VDDA	Analog Supply for Isolator Side 1, This pin must be connected VDDP.
8	VDDL	Side1 I/O logic Power Supply input
9	GND <sub>1</sub>	Isolator Side 1 Ground, The ground reference for VDDL.
10	GND <sub>2</sub>	Isolator Side 2 Ground, The ground reference for VISO_IN.
11	VISO_IN	Secondary Supply Voltage Input for Internal Load, This pin must be connected externally to VISO.
12	VISO	Secondary Supply Voltage Output Load
13	GND <sub>2</sub>	Isolator Side 2 Ground, The ground reference for VISO.
14	GND <sub>2</sub>	Isolator Side 2 Ground, The ground reference for VISO.
15	D2	Logic Output of D
16	DE2	Logic Output of DE
17	R2	Logic Input of R
18	SEL	VISO output voltage select, VISO=5V when SEL pulled up to VISO or floating; VISO=3.3V when SEL pulled low.

## 2. Device Comparison Table

The NIRSP31V devices provide 5V to 5V, 5V to 3.3V, 3.3V to 3.3V conversion modes. The NIRSP31 devices provide 5V to 5V, 5V to 3.3V conversion modes. The output voltage can be set by SEL pin, Supply configuration table is showed below.

VDDP	SEL PIN	NIRSP31V	NIRSP31
VDDP = (4.5V to 5.5V)	SEL = VISO	VISO = 5V	VISO = 5V
	SEL = GND <sub>2</sub>	VISO = 3.3V	VISO = 3.3V
VDDP = (3.0V to 3.6V)	SEL = GND <sub>2</sub>	VISO = 3.3V	/

## 8. Function Description

The NIRSP31 series devices are triple-channel digital isolators with integrated isolated DC-DC converter. The isolated DC-DC converter provide up to 400mW output power using on-chip transformer. The feedback PWM signal is sent to primary side by a digital isolator. The NIRSP31 series devices support 3kvrms insulation 1min withstand voltage. The data rate of the NIRSP31 is up to 20Mbps, and the common-mode transient immunity (CMTI) is up to 50kV/us. The logical level of digital isolators on left side can be set by VDDL pin, which can support the application when the supply voltage and I/O voltage level are different.

The high integrated solution can help to simplify system design and improve reliability. Because of its smaller package of LGA, the NIRSP31 series devices are suitable for the limited PCB space applications. Meanwhile, the devices are also suitable for wide temperature application, which most power modules cannot support.

### 8.1. Device Functional Modes

The NIRSP31 series devices provide triple-channel digital isolators. The digital isolators have default output status when VCCIN is unready and VCCOUT is ready as shown in below table.

VCCIN <sup>1</sup> status	VCCOUT status	Input				Output		Comment
		D	DE	R2	D2	DE2	R	
Ready <sup>2</sup>	Ready	H	H	H	H	H	H	Normal operation
Ready	Ready	L	L	L	L	L	L	
Ready	Ready	floating	floating	floating	H	L	H	
Unready	Ready	X	X	X	H	L	X	
Ready	Unready	X	X	X	X	X	H	

(1) VCCIN is VDDP, VDDA, VDDL and VCCOUT is VISO.

(2) Ready = Powered up; Unready = Powered down; X = Irrelevant; H = High level; L = Low level.

## 8.2. Output Short and Over Temperature Protection

The NIRSP31 series devices are protected against output short. When the devices detect the output is short, the device will be in Hiccup mode and the transferred power will be limited. So the temperature of the device will be low, and the device is protected. The NIRSP31 series devices are also protected against over temperature. When devices detect the chip is over 165°C, the chip will be shut down until the temperature of the device is below 145°C.

## 9. Application Note

### 9.1. Typical Application

The NIRSP31 requires 0.1  $\mu$ F and 10uF bypass capacitors between VDDP&VDDA and GND<sub>1</sub>、 VISO and GND<sub>2</sub>, a 0.1uF bypass capacitor between VDDL and GND<sub>1</sub> , VISO\_IN and GND<sub>2</sub> . The capacitor should be placed as close as possible to the package. This is very important for the performance of the device. The Figure 9.1 is the typical isolated RS485 schematic using NIRSP31.

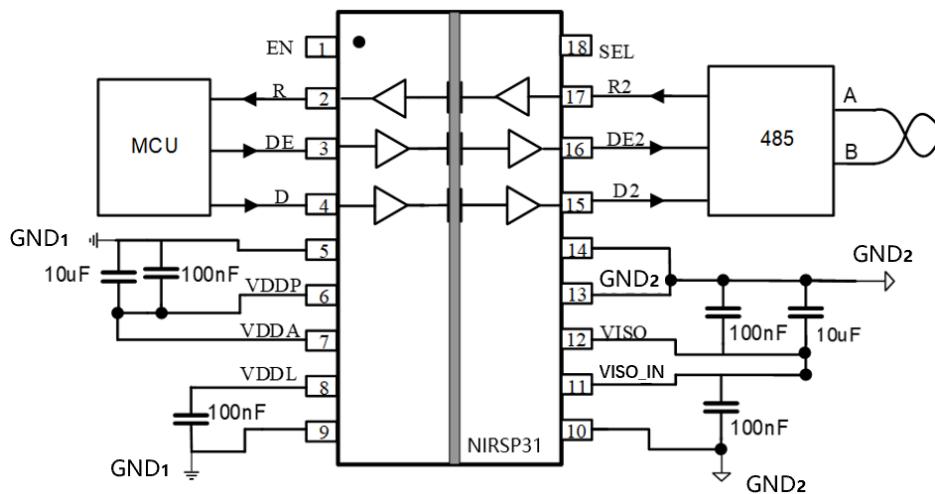

Figure 9.1 Isolated RS485 schematic using NIRSP31

### 9.2. PCB Layout

The low ESR capacitors should be connected between Pin 5 (GND<sub>1</sub>) and Pin 6 (VDDP), Pin 7 (VDDA), Pin 8(VDDL) and Pin 9 (GND<sub>1</sub> ) . The VISO\_IN capacitors are connected between Pin 10 (GND<sub>2</sub>) and Pin 11 (VISO\_IN), The VISO capacitors Pin 12 (VISO) and Pin13 (GND<sub>2</sub>). To suppress noise and reduce ripple, a parallel combination of at least two capacitors is required with the smaller of the two capacitors located closest to the device. The recommended capacitor values are 0.1  $\mu$ F and 10  $\mu$ F for VDDP between Pin 5 and Pin 6. Capacitor values of 0.1  $\mu$ F are recommended for VISO\_IN between Pin 10 and Pin 11, for VDDL Pin 8 and Pin 9. The recommended best practice is to use a very low inductance ceramic capacitor, or its equivalent, for the smaller value capacitors. The total lead length between both ends of the capacitor and the input power supply pin should not exceed 10 mm.
